Testing the First Null Hypothesis

In order to test the first null hypothesis, an independent-test was run to compare the mean scores of the listening comprehension tests in both Simplified and Authentic groups. The t-observed value was 5.94 (Table 1).

Table 1

Independent T-test for Total Listening Comprehension by Groups

The F-observed value for the effect of motivation level is .32 (Table 5). This amount of F-value at 1 and 56 degrees of freedom is lower than the critical value of 4.01.

Based on these results it can be concluded that there is not any significant difference between the mean scores of the high and low motivation groups on the total listening comprehension test.
